

ADHESION - FRICTION

Reference : ADHEFROT

The model makes it possible to study the sliding reaction of different surfaces brought into contact with one another and thus to observe adhesion, friction or sliding.

Composition: a block composed of different surfaces (wood, rubber, felt, sandpaper), and a stand with 3 different materials (wood, felt or PVC). A hook positioned on the block makes it possible to fix a dynamometer and to quantify the friction between different materials.

Dimensions: 500 x 16 x 60 mm
