

GOODS LIFT ENGINE

Reference : MOTGEM12V

This model is equivalent to the 12V manual electric generator, except that it is equipped with a grooved pulley instead of the crank.

The pulley connected to the axis of the motor makes it possible to lift a load held by a wire (delivered).

The hoist motor is equipped with safety sockets and can be powered by either a 12 V DC power supply or a 12 V manual power generator (ref P / GEM12V)

Perfectly illustrates the transfer of electrical energy into mechanical energy.
